

PMO-Driven Transformation at Autofit: From Floor Data to Integrated Governance

About this Case Study This document highlights the strategic execution of a centralized, data-driven PMO Operations Dashboard at Autofit, capturing baseline health, operational misses, and the strategic roadmap to optimize line efficiency and cost controls.

1. EXECUTIVE SUMMARY & CONTEXT

Autofit Overview: Autofit stands as a premier tier-1 manufacturer of high-volume 2-wheeler accessories. Our core production segments-encompassing Handle Assemblies, Wheel Assemblies, Polyurethane (PU) Foaming, and Seat Assemblies-serve major original equipment manufacturers (OEMs), prominently including HMCL.

The PMO's Mission: To transition from fragmented, disjointed floor data reporting to a highly integrated governance structure. By deploying a unified PMO Operations Dashboard, the organization's mission is to proactively drive line efficiency, mitigate risks, and enforce strict cost controls across all manufacturing segments.

2. THE SUCCESS RATE (WHAT IS WORKING WELL)

The operational data gathered through the PMO Dashboard demonstrates excellent baseline health. Core production and quality plans are not only being met but systematically exceeded.

Production & Despatch Excellence

Cumulative actual production has consistently outpaced planned capacity across all key segments. Furthermore, despatch targets were successfully met without triggering any OEM line stoppages at HMCL.

- **Handle Assembly:** Achieved ~45.8 vs. 44.5 plan.
- **PU Foaming:** Achieved 47.2 vs. 46.0 plan.
- **Wheel Assembly:** Reached 46.2 vs. 45.0 plan.

Quality Threshold Management

Both in-house and customer-facing quality metrics are tracking exceptionally well, operating comfortably below their respective maximum error thresholds.

- **Customer CID PPM:** Dropped to **42 PPM**, significantly below the ceiling plan of 60 PPM.

- **In-House Rejection PPM:** Held steady at **65 PPM** against a maximum threshold plan of 90 PPM.

3. IDENTIFYING THE "MISSES" & SHORTCOMINGS (THE GAPS TO SOLVE)

Despite strong output and exceptional quality metrics, the PMO Dashboard's deeper analytical layer revealed underlying operational risks that threaten long-term scalability and profitability.

High production volumes are currently masking critical supply chain friction and utility vulnerabilities.

Material Supply Chain Friction

Significant material shortages occurred during the cumulative tracking period, threatening the continuity of our highly dependent assembly lines.

- **Wheel Assemblies:** Cumulative shortage of **30 items**.
- **Handle Assemblies:** Cumulative shortage of **20 items**.

Material Shortages (Count of Items)

External Dependencies (Power Cut Vulnerability)

Power outages have generated unnecessary waste and exposed a lack of resilient backup power

synchronization, directly impacting our most sensitive processes like PU Foaming and molding.

- **In-House Power Cut Rejection:** Reached **12 PPM**.
- **Power Cut Scrap:** Accounted for **21 Kg** of raw material waste.

Tight Unit Economics & Cost Variances

The dashboard highlighted high per-piece input costs across three primary drivers: - **Manpower** - **Energy** - **Consumables**

Strict operational control is required to prevent these variances from eroding overall profit margins.

4. THE PMO STRATEGIC ACTION PLAN

To address these gaps, the PMO has outlined a focused 30-60-90 day forward-looking roadmap:

30-60-90 Day Roadmap

- **Material Stability (30 Days):** Implement a robust Just-In-Time (JIT) material replenishment buffer. Enforce stricter Vendor Service Level Agreements (SLAs) to entirely eliminate the 30+ item shortages currently impacting critical assembly lines.
 - **Scrap & Risk Mitigation (60 Days):** Deploy an Automated Generator / UPS Synchronization mechanism. This will protect the PU Foaming and molding cycles from instant power-cut defects and eliminate the 21 Kg of associated scrap.
 - **Cost Optimization (90 Days):** Initiate a dedicated Lean Six Sigma project focused heavily on lowering per-piece energy and consumable costs through comprehensive line balancing and waste reduction.
-

5. LESSONS LEARNED & CONCLUSION

The Real Value of the PMO Dashboard The most critical lesson learned during this transformation is that relying solely on top-line numbers can be deceiving. The integrated PMO dashboard allowed executive management to see that while "hitting production targets" was a visible success, it was actively masking costly material friction and severe utility vulnerabilities underneath.

By pivoting from fragmented floor tracking to centralized, data-driven PMO governance, Autofit has successfully transitioned from reactive troubleshooting to proactive operational excellence. The organization is now equipped to sustain high volumes, uphold stringent OEM standards, and aggressively protect profit margins.
